The specification describes a metal ion-specific, affinity sensor that measures capacitance. The sensor comprises a piece of noble metal to which are bound groups that bind specifically to selected heavy metal ions. These groups are bound to a self-assembling monolayer that covers at least 90%, more preferably at least 99% of the noble metal surface. The noble metal is a rod or piece of insulating material (91ass, quartz or silica) on which a noble metal is sputtered. The sensor is used for qualitative or quantitative detection of selected heavy metal ions in liquid samples, particularly of zinc, mercury, cadmium, copper and lead in e.g. environmental samples, medicines, foods and other products.

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                             290

                                                                     Shewchuk L.M., Verdine G.L., Nash H., Walsh C.T.;

"Mutagenesis of the cysteines in the metalloregulatory protein MerR
indicates that a metal-bridged dimer activates transcription.";

Biochemistry 28:6140-6145(1989)

-I- FUNCTION: MEDIATES THE MERCURIC-DEPENDENT INDUCTION OF MERCURY
RESISTANCE OPERON. IN THE ABSENCE OF MERCURY MERR REPRESSES
TRANSCRIPTION BY BINDING TIGHTLY TO THE MER OPERATOR REGION;
WHEN MERCURY IS PRESENT THE DIMERIC COMPLEX BINDS A SINCLE ION
AND BECOMES A POTENT TRANSCRIPTIONAL ACTIVATOR, WHILE REMAINING
BOUND TO THE MER SITE.
                                                                                                                                                                                                                                                                                                                                                 Misra T.K., Brown N.L., Fritzinger D.C., Pridmore R.D., Barnes W.M., Haberstroh L., Silver S.; "Mercuric ion-resistance operons of plasmid R100 and transposon Tn501: the beginning of the operon including the regulatory region and the first two structural genes."; Proc. Natl. Acad. Sci. U.S.A. 81:5975-5979(1984).

"Mercury operon regulation by the merr gene of the organomercurial resistance system of plasmid pDU1358.";

J. Bacteriol. 171:4241-4247 (1989).

-i- FUNCTION: MEDIATES THE MERCURIC-DEPENDENT INDUCTION OF MERCURY RESISTANCE OPERON. IN THE ABSENCE OF MERCURY MERR REPRESSES TRANSCRIPTION BY BINDING TIGHTLY TO THE MER OPERATOR REGION; WHEN MERCURY IS PRESENT THE DIMERIC COMPLEX BINDS A SINGLE ION AND BECOMES A POTENT TRANSCRIPTIONAL ACTIVATOR, WHILE REMAINING BOUND TO THE MER SITE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PRINTS; PRO0040; HTHMERR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in response to increasing copper concentrations (By simila SUBUNIT: Homodimer (Potential).

SUBCELLULAR LOCATION: Cytoplasmic (Probable).

DOMAIN: It contains a N-terminal DNA binding region and a terminal metal binding region (By similarity).

SIMILARITY: BELONGS TO THE MERR FAMILY OF TRANSCRIPTIONAL REGULATORS. CUER SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Regulates the transcription of the copA and cueO genes It detects cytoplasmic copper stress and activates transcription in response to increasing copper concentrations (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                        AE004179; AAF94136.1;
                                                                                                                                                                                                       proteome.

-i- FUNCTION: COMPONENT OF THE EXOSOME 3->5 EXORIBONUCLEASE COMPLEX.

REQUIRED FOR THE 3' PROCESSING OF THE 7S PRE-RNA TO THE MATURE
5.8S RRNA. HAS A 3'-5' EXONUCLEASE ACTIVITY (By similarity).

-i- SUBUNIT: COMPONENT OF THE EXOSOME MULTIENSYME RIBONUCLEASE COMPLEX

COMPOSED OF AT LEAST 11 PROTEINS: RRP4, RRP40, RRP41/SK16, RRP42,

RRP43, RRP44/DIS3, PM/SCL-75, RRP46, CSL4 AND PM/SCL-100 (ONLY IN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CATALYTIC ACTIVITY: L-alanine = D-alanine.
COFACTOR: Pyridoxal phosphate (By similarity).
PATHWAY: Along with D-alanine--D-alanine ligase, it makes
D-alanine branch of the peptidoglycan biosynthetic route.
SIMILARITY: BELONGS TO THE ALANINE RACEMASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Į

"tpr homologues activate met and raf.";

Oncogene 2:617-619(1988).

-i- function: Component of the cytoplasmic fibrils of the nuclear pore complex implicated in nuclear protein import. Its amino terminus is involved in activation of oncognic kinases.

-i- Subcellular location: Cytoplasmic Surface of the nuclear pore complex. The assembly of the NPC is a Stepwise process in which the complex is a sasembly of the NPC is a Stepwise process in which the complex. The assembly of the NPC is a Stepwise process in which the components, including peripheral structures assemble after other components, including p62.

-i- tissue specificity: Highest in testis, lung, thymus, spleen and brain, lower levels in heart, liver, and kidney.

-i- debase: involved in tumorigenic rearrangements with the met, trk
